Here’s How to Prepare

1. Fill the burlap bag ¾ full of wet manure or fresh leaves or compost.

2. Tie the open end of the bag then place into the empty drum (regular size 220 liter or 55 gallon capacity).

3. Place a big stone to hold the bag down and fill the drum with water and cover.

4. Apply the liquid fertilizer around the roots of the base of plant (avoid any direct contact with plant to prevent “burning” of leaves) 2-3 weeks after germination or immediately after transplanting. Repeat after 3-4 weeks.

5. After 3 weeks, remove the bag from the drum. Dilute solution at a ratio of 1 part liquid fertilizer to 4-6 parts fresh water.
